In order to avoid twisting and kinking it is usual to coil the ROV umbilical in a figure of 8 on deck or over cow horns mounted on a bulkhead and then pay out and recover the umbilical by hand.

The use of an umbilical winch is a more convenient and space saving solution.

The Series 5 umbilical hand winch has a capacity of 450 meters of 13 mm umbilical. A slip ring is included so that umbilical can be reeled in and out during ROV flying operations. With a frame and drummed constructed of polypropylene with aluminum spacer bars, this new IP68 rated hand winch is 15 kilos lighter than previous units.
